## ARRIÈRE PLAN

All health workers would benefit from gaining knowledge and skills to protect individuals and communities from air pollution exposure. This course examines the main health impacts of air pollution and which roles health workers can play to protect and promote people's health.

## OBJECTIFS DE L'ÉVÉNEMENT

- Describe what are the main air pollutants and their sources;
- Describe how humans are exposed to air pollutants;
- Explain the main health effects of air pollution and which are the populations at higher risk;
- Recognize the health benefit of both ambient and household air pollution interventions at the population and individual level;
- Outline the leading role health workers can play to address air pollution and health issues with individuals, patients, and communities.

## CONTENU ET STRUCTURE

Air pollution is a major environmental risk causing about 7 million premature deaths per year. These deaths are mostly caused from non-communicable diseases (NCDs) – such as ischemic heart disease, stroke, chronic obstructive pulmonary disease and lung cancer – but also from acute lower respiratory tract infections, such as pneumonia.

To date, air pollution – and more broadly environmental health – is not sufficiently addressed in the curricula of health professionals. Yet, the engagement of the health sector and the health community is pivotal to boost advocacy and political action for clean air. This requires a strong effort by governments and civil society willing to increase the awareness of current and future health workers to tackle the health effects of air pollution.

## MÉTHODOLOGIE

**Approximate course duration:** 4 hours.

### Languages

This course is available in the following languages: English.
