Geo-Information for Impacts and Needs Assessment

Type:	Course
Emplacement:	Geneva, Switzerland
Date:	11 Fév 2013 to 12 Fév 2013
Durée:	2 Jours
Domaine du programme:	Satellite Imagery and Analysis
Site internet:	http://www.unitar.org/unosat
Prix:	0.00 $US
Email du point focal de l'événement:	unosat@unitar.org
Partenariat:	Centre for Education and Research in Humanitarian Action (CERAH)

CONTEXTE

The last decade has seen a marked increase in large-scale, "natural" disasters resulting in overwhelming challenges for humanitarian organisations, especially in urban environments.

Case studies and examples during the course will take into account the three major contexts for humanitarian action: armed conflict / complex emergencies, "natural" disasters, social exclusion. Chronic crises, and the interplay between

humanitarian action and development activities will be given due consideration.

OBJECTIFS DU COURS

The goal of the course is to advance a better understanding on how humanitarian workers can better respond to such disasters by understanding the complexities associated with aid projects delivered in these contexts.

OBJECTIFS D'APPRENTISSAGE

Upon completion of the course, the participants will be able to:

- Define a GIS and how and why we use it
- Explain the benefits and limitations of using satellite images for impact analysis and damage assessment
- Extract and critically assess information contained within a map
- Outline GIS methodologies to perform impact analysis and preliminary damage assessment and associated challenges.
- Gather and assess relevant spatial data from the web for emergency response mapping
- Collect data in the field using GPS devices and share it using Google Earth.

CONTENU ET STRUCTURE

The course is extended over 2 work days structured around the following topics:

Day 1

- Introduction to GIS and Remote Sensing
- The use of satellite imagery for emergency response mapping
- Map reading

Day 2

- Impact analysis and damage assessment using GIS (context and case example)
- Gathering geo-spatial data from the web
- Collecting and sharing geo-spatial data (Practical Excercise)

MÉTHODOLOGIE

The course has a mixture of adult learning methodologies such as interactive lectures, discussion sessions and group excercises. The participatory nature of the programme requires that participants contribute actively to discussions and group work on case studies.

AUDIENCE CIBLE

Participants are expected to have some prior knowledge of the subject area Participants must:

- Have a bachelor’s degree or an equivalent university degree.

Primary Audience

- CERAH Master students in humanitarian action.
- National and international actors working with national, international, or nongovernmental organisations dealing with one or several dimensions of the disaster risk management cycle (e.g. crisis management, preparedness, recovery, prevention)
