

Operational Application of Geospatial Information Technology for the UN in Asia and the Pacific

United Nations Satellite Centre UNOSAT

Type:	Course
Emplacement:	Bangkok, Thailand
Date:	7 mai 2019 to 10 mai 2019
Durée:	4 Days
Zone du programme:	Satellite Imagery and Analysis
Site internet:	http://www.unitar.org/unosat
Prix:	0.00 \$US
Personne de référence de l'événement:	khaled.mashfiq@unitar.org
Partenariat:	UNESCAP

CONTEXTE

Over the last two decades Geo-spatial Information Technology (GIT) has rapidly developed and is now being also called an “enabling technology” due to the benefit it offers across different application domains. GIT can help us to analyse why and where things have happened in the past. It can also help us to better understand why and where they might happen in the future, allowing us to make

informed decision and maximum use of our resources.

OBJECTIFS DU COURS

UNOSAT is offering an introductory course in the use of GIT applications relevant to different application domains relevant to various UN agencies. The course is designed to accommodate selected participants from UN Agencies from Asia-Pacific region.

OBJECTIFS D'APPRENTISSAGE

The aim of the course is to provide participants with GIS and RS methodologies related to different cross-cutting themtics like disaster risk reduction, sustainable development.

At the end of the course participants should be able to:

- Define and describe basic concepts and terminology related to GIT (e.g., geospatial information system and remote sensing)
- Identify, search, collect, organize geospatial data/information
- Apply basic geospatial analysis methods for problem solving
- Undertake the process to create desktop maps, web maps and infographics for supporting decision making

CONTENU ET STRUCTURE

The course will provide participants with a theoretical understanding of basic principles of GIS and Remote Sensing (RS), how to collect data using geospatial tools such as GPSs, smart phones and basic functionalities of GIS software needed to perform basic spatial analysis and thematic desktop and web maps will also be introduced.

This is a full-time, face-to-face course with lectures and GIS lab exercises using GIS datasets and real case scenarios (60% lab exercises, 40% lectures and discussions). This course is divided into 4 modules. Each module is structured into 2 sessions of 1.5 hour each (half-day session in the morning). The average

workload per day is likely to be around 3-4 hours.

MÉTHODOLOGIE

The course is designed in a way to have a balanced approach between theoretical and practical teaching methods consisting in PowerPoint presentations, live demos, videos, interactive sessions and GIS lab exercises. At the end of the course. UNITAR-UNOSAT will set up a community of practice platform to maximize the learning experience of participants and to provide all required technical backstopping and assistance to training participants during and after the training.

AUDIENCE CIBLE

Professionals working in United Nations in Asia and the Pacific region and who wish to strengthen their practical skills in GIS/RS applications related to disaster risk reduction and sustainable development.

Participants are recommended to attend a 4 hours long course "[Getting Started with GIS](#)" from ESRI.

INFORMATIONS SUPPLÉMENTAIRES

Language:

English

Software:

GIS lab exercises will be based on ESRI ArcGIS editor 10.6 with extensions (spatial analyst), Google Earth and internet access.

Fees:

UNITAR-UNOSAT will deliver this course free of charge under existing collaboration agreement between UNESCAP and UNITAR

Class Size:

The number of participants is limited to 10.

UNITAR Certificate:

Students will be awarded certificates from UNITAR on successful completion of the course
