The course aims to provide students with knowledge and skills regarding the basic concepts of Women's Health and Nursing, women's health indicators and needs, and the holistic approach to protecting and promoting women's health. It covers topics such as pregnancy, childbirth, postpartum care, family planning, and reproductive health practices.

Explains the basic concepts and indicators of women's health. Lists the principles related to the protection, promotion, and maintenance of women's health. Classifies the various stages of a woman's life. Creates a care plan to meet the needs of women and newborns during the pre-pregnancy, labor, and postpartum periods. Explains the care principles for common gynecological issues. Explains infertility and assisted reproductive techniques. Develops an education plan on family planning and reproductive health.

Explains the basic concepts and indicators of women's health. Lists the principles related to the protection, promotion, and maintenance of women's health. Classifies the various stages of a woman's life. Creates a care plan to meet the needs of women and newborns during the pre-pregnancy, labor, and postpartum periods. Explains the care principles for common gynecological issues. Explains infertility and assisted reproductive techniques. Develops an education plan on family planning and reproductive health.

This course is designed to provide students with comprehensive knowledge and skills related to women's health and nursing, focusing on holistic care approaches, reproductive health, pregnancy, childbirth, family planning, and addressing common gynecological issues.

This course attempts students to gain knowledge through the course subjects with aid from 6 books and lecture notes. The course assesses knowledge with one midterm exam and one final exam alongside a project to further implement knowledge.
